

DAIMLER INDIA COMMERCIAL VEHICLES

INTERNSHIP COMPLETION REPORT

Supplier Digitalization & Real-Time Data (SQD) — Qprime Program

Intern Name	Aarush Jagannathan
Institution	Vellore Institute of Technology, Chennai
Programme	B.Tech, Electronics and Computer Engineering
Department	Supplier Quality Development (SQD)
Project	Qprime — Supplier Digitalization & Real-Time Data
Duration	01 June 2026 – 30 July 2026
Mentor	Manager Ramasamy Subramanian
Guided by	Pradeep, Kamal, Sarath, Pavithra, Kathir, Kirran, Sathya, Anwesha and Narendran
Report Type	End-of-Internship Summary of Work Completed

Settling In

Daimler India Commercial Vehicles was a completely new environment for me when I walked in, and the first stretch of my time here went into simply learning how things work. Sarath Sir and Narendran Sir walked me through the starting task of understanding how the company works — who DICV works for, how the Supplier Quality Development (SQD) team is structured, what each team within it does, and which person is responsible for what. This grounding in how the organization and my own team operate made everything that followed much easier to pick up, including learning Power BI from scratch to build reports directly from Excel-based supplier data.

Work and Tasks Completed

- Learned to build **Power BI** reports from raw Excel sheets — cleaning and structuring supplier data into a proper model, and creating interactive visuals such as donut charts, gauges and ranked bar charts.
- Was assigned real-time data (RTD) implementation tracking and management across **107 suppliers** spread across different supplier managers, and built a live dashboard to track their progress. Anwesha Mam, along with Sarath Sir and Narendran Sir, helped me through handling this real-time data work.
- Structured supplier progress on the dashboard against the **10-step RTD rollout process**: AOI status, Parameter Clarity, Inspection by IoT gauges/fixtures, Confirmation of data storage at supplier, DMC availability, Acceptance for data sharing, API Feasibility Implementation, Data transfer via API (trials), Go-live QA, and Go-live Production.
- Added status tracking (Completed / Pending / Not Available / Not Known) and a days-remaining countdown so the team could immediately see suppliers at risk of missing deadlines, and tracked denied or non-responsive suppliers separately for escalation.
- Followed up directly with supplier managers to push suppliers through each stage of the real-time data process, and compiled and circulated a weekly report of the dashboard across the whole SQD network — this dashboard became the running single source of truth for RTD status across all 107 suppliers.
- Was given the topic of digitalization to present at the **Qprime Conclave**, and researched new, innovative and varied approaches to digitalization applicable to suppliers of different sizes and maturity levels, including where in a supplier's operations each approach could be implemented.
- Authored a **Supplier Digitalization Handbook**, presented as a PowerPoint deck, written in simple, accessible language for easy understanding by suppliers and non-technical stakeholders.
- Additionally created a detailed supporting document covering each digitalization implementation and area in greater depth, for readers who needed more in-depth technical or procedural detail than the handbook slides could carry.
- Designed a **Digital Transformation Priority Checklist** — a scoring matrix that anyone can use during a digitalization audit, where each initiative is scored 1–5 across five criteria (Implementation Effort, Cost/Investment, Business Impact, Technological Maturity and Data

Dependency), and the total score automatically maps to a Roadmap Priority tier from “Priority 1: Quick Win” through “Priority 6: Future-Ready”.

- Created an AI-generated introductory video presenting our team, intended for our new L3 (department head), and designed it to also be reusable as a generic team-introduction asset for any future event or audience.

Figure 2 · Digital Transformation Priority Checklist — scoring matrix mapping total score to a six-tier Roadmap Priority.

Skills I Gained

- **Power BI:** data modeling from Excel, DAX-based visuals, gauges, donut charts, ranked bar charts, and slicer-driven interactive dashboards.
- Structured, milestone-based process tracking across a large (100+) supplier base and multiple stakeholder owners.
- Weekly stakeholder reporting and cross-functional coordination with supplier managers.
- Learned what digitalization actually means in a large OEM/supplier ecosystem — not just software, but connecting physical shop-floor activity (machines, gauges, inspection stations) to real-time digital records.
- Studied different digitalization techniques applicable to suppliers: IoT-based sensor integration for machine and process data, barcode/RFID-based tracking for parts and inventory, vision-based and automated inspection systems for quality checks, API-driven real-time data exchange between supplier systems and the OEM, and cloud-based dashboards for live visibility.
- Learned where digitalization can be applied across a supplier's operations — shop floor and machine monitoring, quality inspection and gauge data capture, inventory and warehouse tracking, logistics and dispatch, and data storage/reporting layers.
- Understood the difference between low-cost, quick-to-implement digitalization (e.g. barcode scanning, simple sensor logging) versus larger, capital-intensive digital transformation (e.g. full MES/ERP integration, digital twins) — and how to evaluate which fits a given supplier's size and maturity.
- Learned how to assess digitalization readiness and prioritize initiatives using structured criteria — effort, cost, business impact, technological maturity and data dependency — which fed directly into the Priority Matrix I built.
- Got exposure to how OEMs like DICV drive digitalization outward into their supplier base, not just internally, balancing standardization needs (real-time data format, API compatibility) with the practical constraints smaller suppliers face (cost, technical skill, existing infrastructure).
- Technical writing and content design — translating a technical subject (digitalization) into an accessible handbook and a detailed reference document for a mixed audience.
- Framework and tool design — building a simple, reusable scoring matrix for prioritization and audit use.
- Exposure to enterprise quality programs (Qprime) and how OEM–supplier digital transformation initiatives are structured and communicated.

Closing Note

Looking back, this internship took me from knowing nothing about how DICV or SQD worked to independently owning a live reporting dashboard for 107 suppliers, and researching, authoring and presenting digitalization content and tools at the Qprime Conclave. I am grateful to Manager Ramasamy Subramanian Sir for his mentorship, and to Sarath Sir, Narendran Sir, Anwesha Mam, Pradeep Sir, Kamal Sir, Pavithra Mam, Kathir Sir, Kirran Sir and Sathya Mam for their guidance and support throughout, and for trusting me with real, visible work.
